WHY THE NEW MODEL MATTERS

Qwen3-VL-Embedding-2B, released in January 2026, retrieves moments from pixels and natural language. Source filenames and captions are not embedded.

Geometry and appearance checks verify shared imagery. Temporal fitting estimates the source interval and playback change, with explicit ambiguity when the evidence is weak.

MEASURED RESULTS, WITH THEIR SCOPE

32/32 edited queries recovered
8/8 negatives rejected
Four-source controlled evaluation; no false source matches. Synthetic edits, not an internet-wide accuracy estimate.

Additional-film check: 7/8 edits verified, 2/2 negatives rejected. One correctly retrieved clip failed temporal verification. No thresholds were changed after that result.

TRY IT IN 60 SECONDS

Trace the cropped repost. Inspect two frame pairs. Export its packet, then open Verify a packet to check the included files in your browser. The hosted demo shows real saved runs; the local service accepts new sources and queries.

Interactive demo **Source code + reproduction** **Captioned 2:15 walkthrough**

A match establishes shared imagery, not ownership, infringement, or first publication. Checksums are not signatures.

Figure: real measured evidence, not a browser screenshot. Tears of Steel: (CC) Blender Foundation | mango.blender.org, CC BY 3.0. Application: MIT; dependencies retain their own licenses.
